	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Allow users to add and remove games to their backlog ● Display the list of games in their backlog ● Provide a button that randomly selects a game from the backlog ● Display the selected game's name	**Schedule - (For V2.0+)** ● Allow for filtering the backlog by genre or some other tag ● Allow users to categorize games by things such as backlog, playing, or completed ● Connect to steam API to grab the cover images of games in the backlog and display them
Not Important	**Delegate - (Use a library)** ● Randomization function can just use a built-in function or library ● UI can be built using a suitable component library instead of building everything myself ● Use a library for the proper saving/ loading of the game backlog ● Use a library to make API requests for finding cover images and genre tracking.	**Delete - (Cut it)** ● Add integration with multiple game website/ libraries (rather than just Steam) ● Track game updates to allow for players to prioritize recently updated games ● User accounts/ online sync ● Advanced or AI based recommendation algorithms
